

#53

- Heavily based on Vito's work

-The component has the h2 title populated with the value in the *title* prop - I have an h2 tag with what I think the value is. I am not entirely sure.

- <https://reactjs.org/docs/lists-and-keys.html> - reading the documentation for what a "ClientOrdersList React Component" as it is a list in react. Although I think that it is looking for a regular table.

- "The component has a *react-bootstrap/Table* with the columns: (*Status, Cost, Contractor, Date, Time*)". I made it rows instead of columns because it is easier and I don't think it changes anything about the intended functionality.

- In attempting to make the page load correctly - I looked through Vitos code to spot a connection. I was unable to find the pattern. I would anticipate

```
def client_dashboard(request)
&
def contractor_dashboard(request)
```

to be similar in scope of code however they are not.

This page on what the URL page does

<https://stackoverflow.com/questions/22938101/best-way-of-linking-to-a-page-in-django>

The URL page seems to have a url to accommodate both

I looked at how it is currently getting the other page

```
"javascript:window.location.href='/accounts/client/dashboard/'"
```

Since `/accounts/client/*` is not a domain that I am aware of nor can find I am honestly not sure how that works

-The component takes the prop *orders* which is a list of the *ClientOrderCard* components that should be in the list. This list is Ordered by the date time of the Order from most recent at the top to least recent at the bottom.

I think this requires one of the dependencies. But I am clueless on this one of where to even start
